

Executive Summary

This project analyzes retail sales data using Power BI and presents interactive KPIs and business insights.

Objective

Build an interactive dashboard and perform deep-dive business analysis.

Dataset

1000 records, 12 columns including customer, product, category, quantity and sales.

KPIs

Revenue 139.40M, Orders 992, Customers 947, Quantity Sold 5.435K.

Dashboard Analysis

Includes KPI cards, product-wise sales, category-wise sales, city map, gender distribution, city-category comparison and slicers.

Insights

Revenue is strong; electronics and laptops perform well; customer base is broad; city filters reveal regional trends; balanced gender contribution; dashboard supports decisions; top products drive sales; geographic analysis identifies growth markets; quantity sold indicates healthy demand; KPIs simplify monitoring.

Recommendations

Focus on top products, optimize weak categories, strengthen marketing in top cities, monitor KPIs monthly, expand analytics with forecasting.

Conclusion

The dashboard transforms raw data into actionable insights and supports business decisions.
